FRONTEND COMMERCE CASE

HardSoft Website Redesign

This repository started as a course-style static site. It now works as a more credible commercial frontend demo by adding English-first copy, clearer product logic, a structured inquiry flow, and a lightweight client portal that supports the sales narrative.

Customer-facing screens documented in the final case study

8

Configurations organized into a guided, filterable catalog

1

Consistent commercial narrative across homepage, catalog, contact, and portal

Purpose and working hypothesis

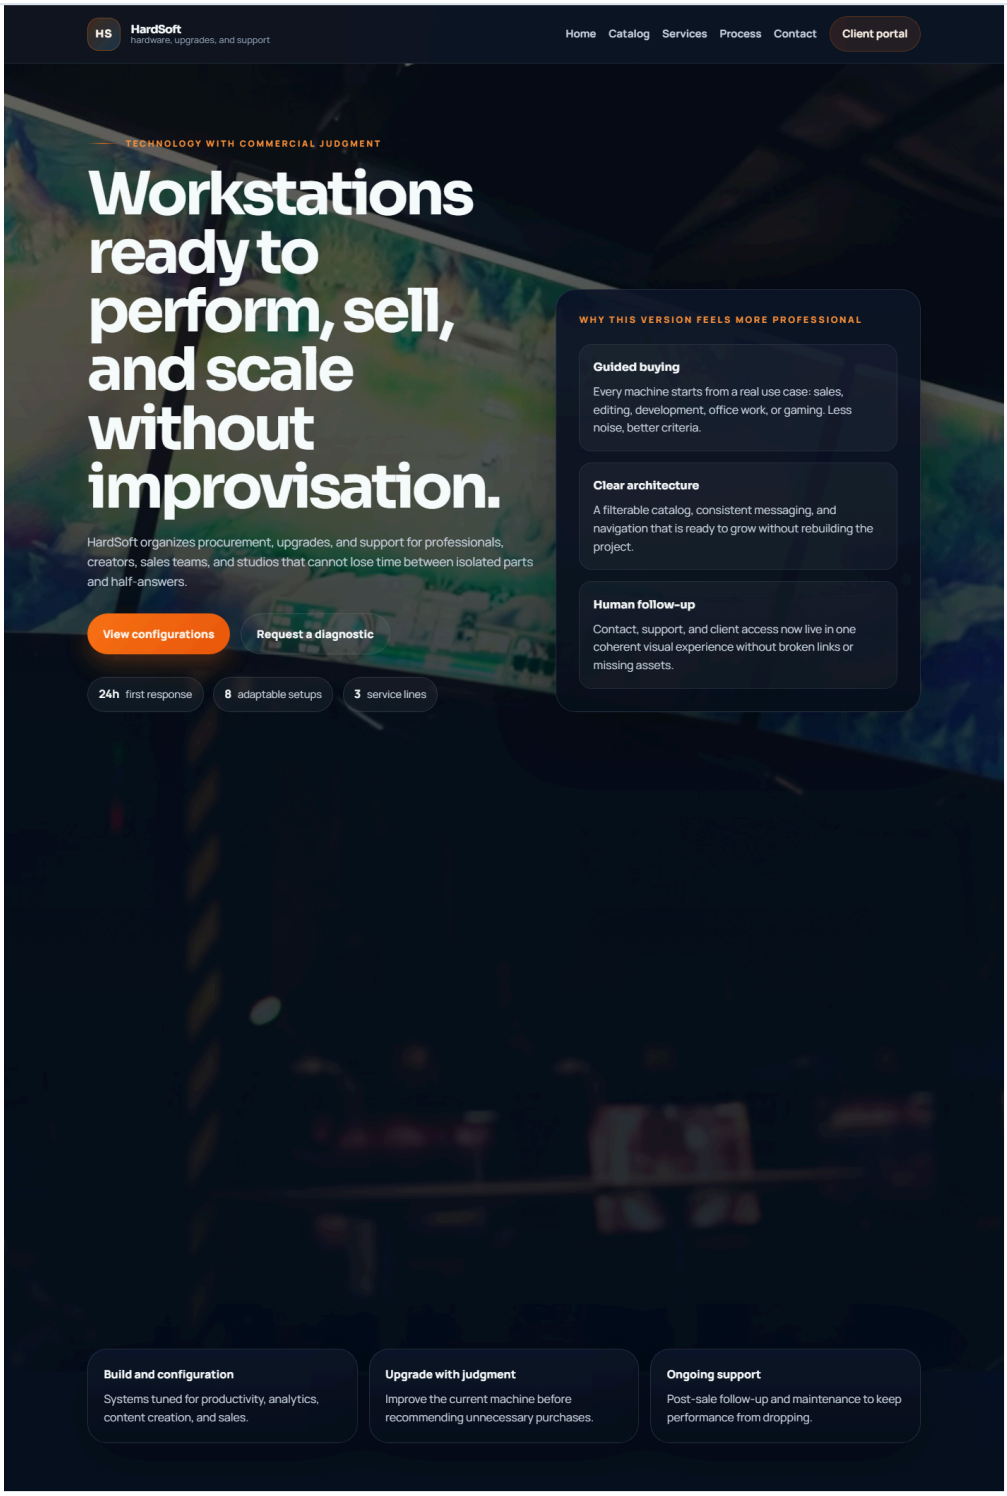
The redesign tests a practical product question: can a simple static storefront feel significantly more professional once the information architecture, commercial copy, and interaction flow are tightened?

> Main hypothesis: clearer product segmentation and a stronger inquiry path improve perceived trust, commercial clarity, and portfolio value even without a backend.

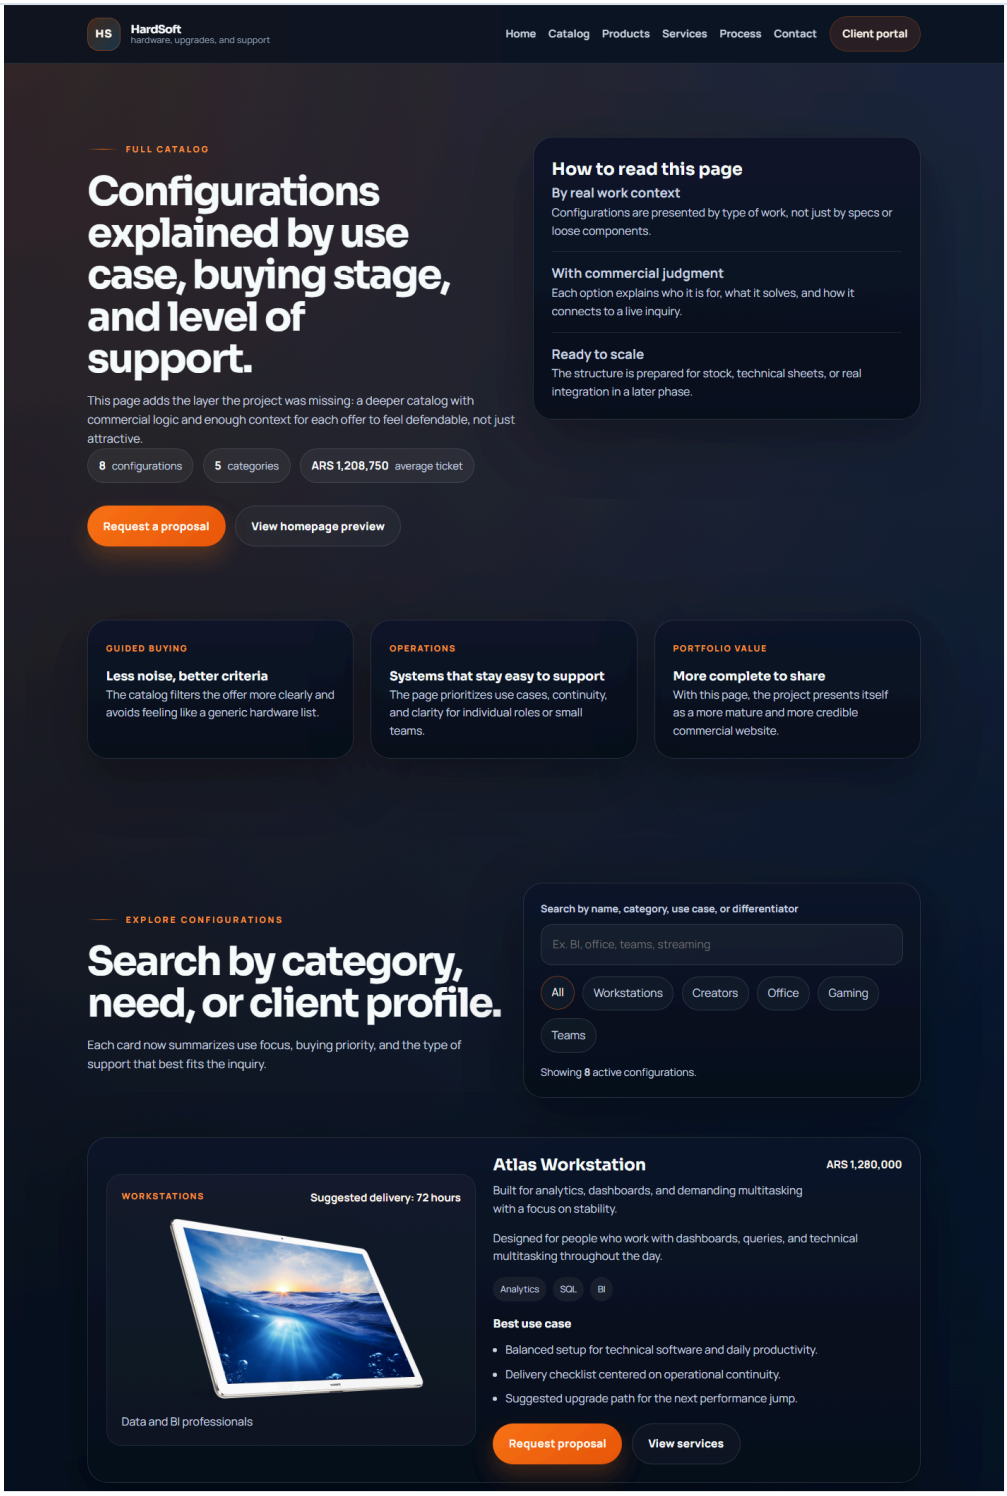
- The homepage should explain the offer in business terms, not just show products.
- The catalog should help people browse by use case instead of reading a flat product list.
- The contact and portal screens should make the project feel more complete and more sellable.

Homepage and catalog

The homepage now frames the business around guided buying, upgrades, and operational support. The catalog adds context, not just inventory.



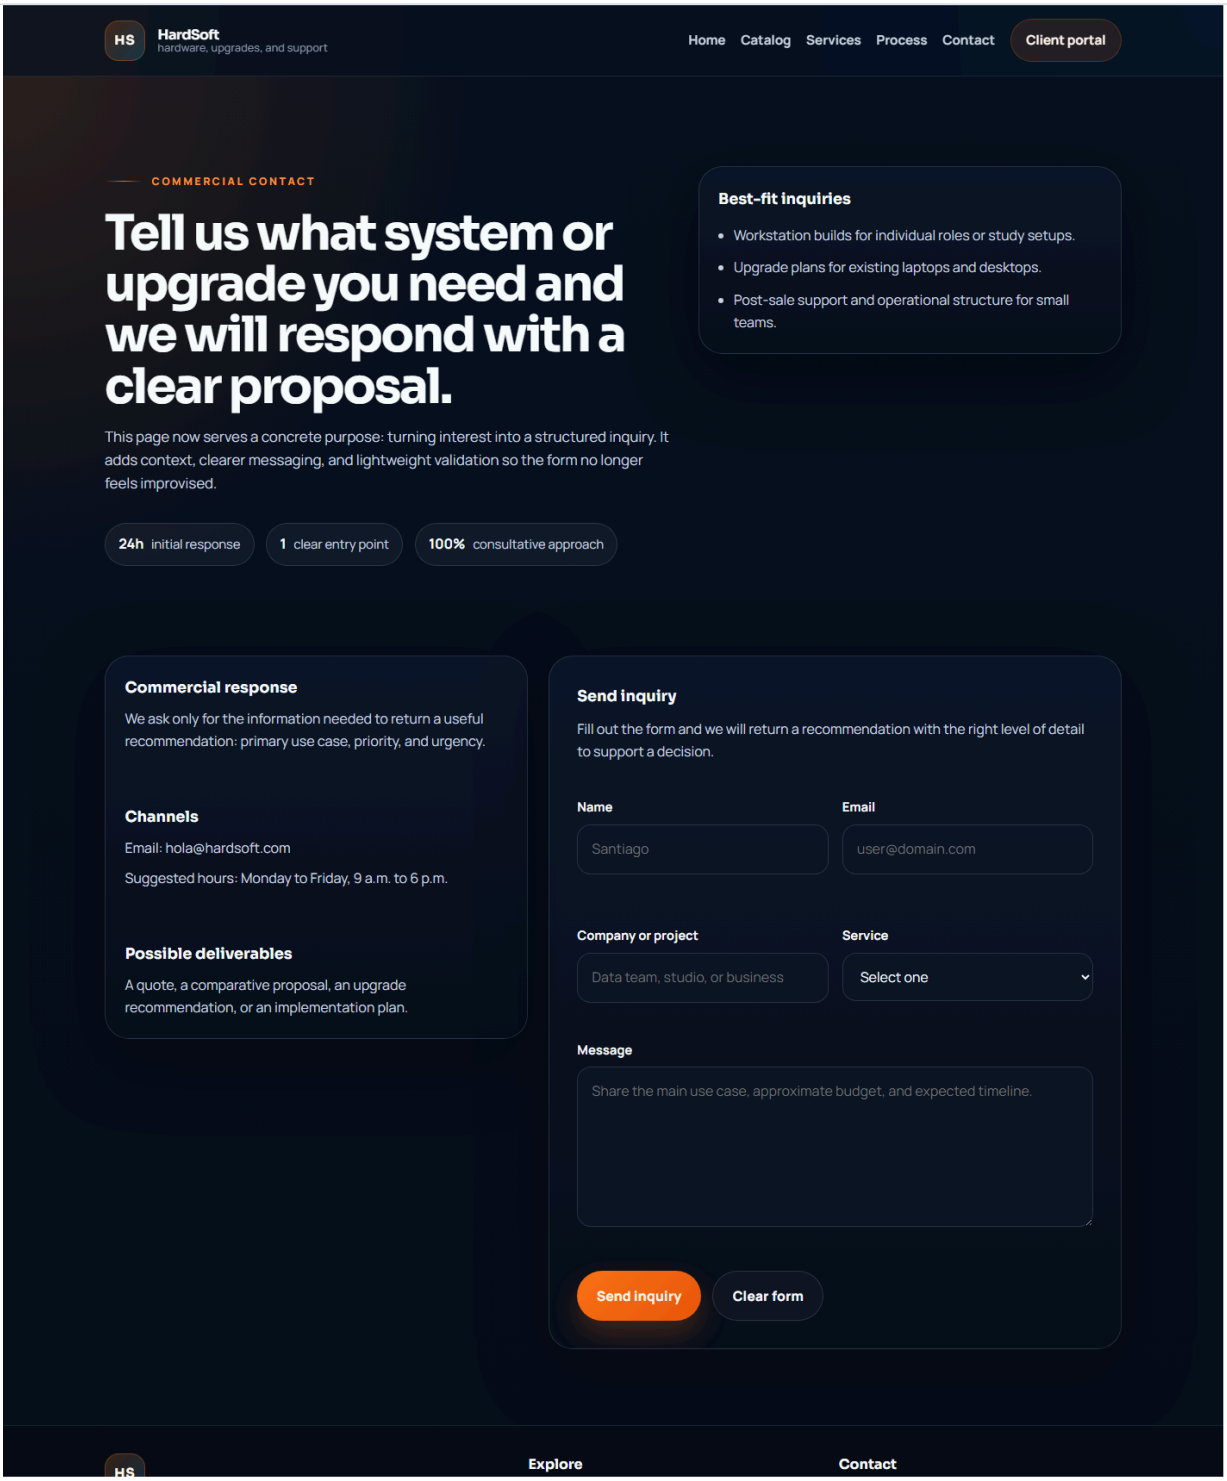
The homepage now communicates positioning, value, and service logic instead of reading like a generic student landing page.



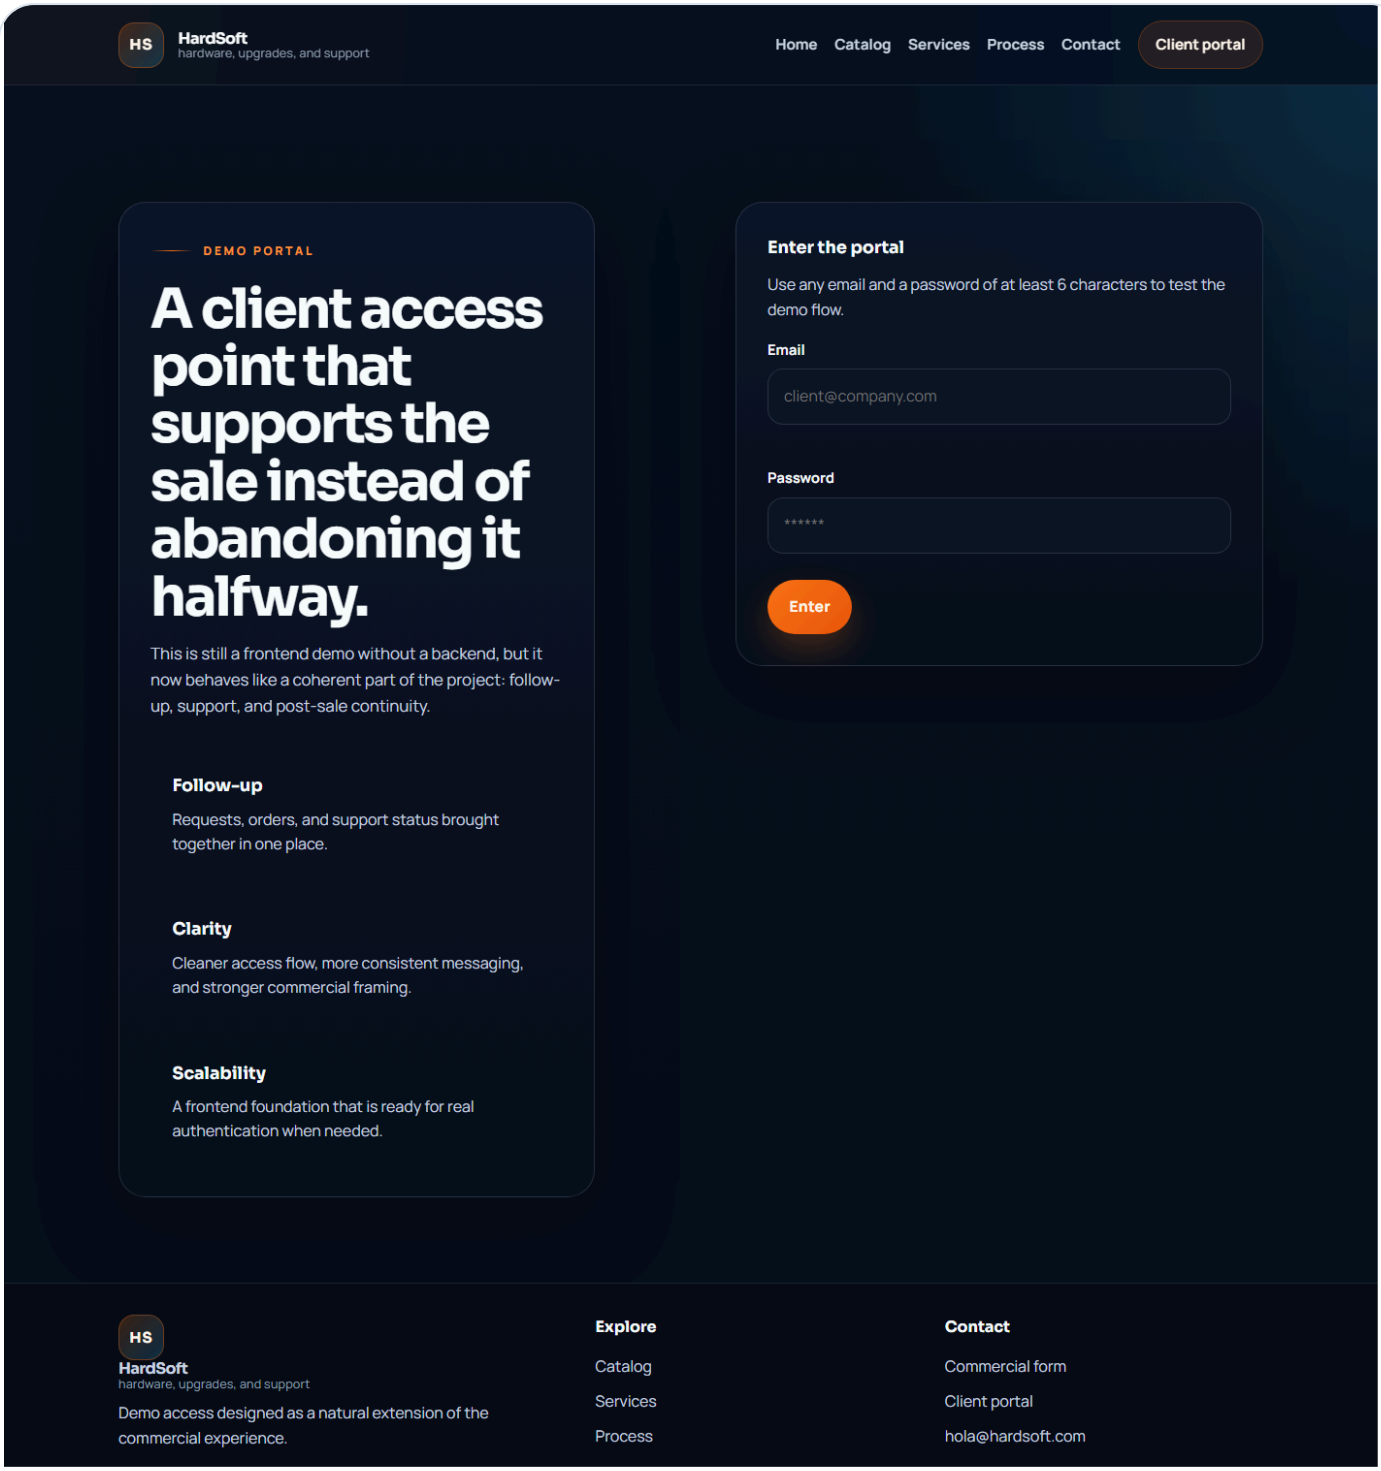
The product page organizes eight configurations by category, commercial use case, and support path, which makes the project much easier to share as a business-facing demo.

Contact and client experience

The contact page and portal are still frontend-only, but they now extend the product logic instead of feeling disconnected from it.



The contact flow now validates inputs, pre-fills context from the catalog, and sounds like a commercial inquiry rather than a generic form.



The demo portal adds post-sale continuity and makes the overall experience feel more like a real customer journey.

Improved conclusion

The strongest outcome is not technical complexity. It is perceived seriousness. By translating the full frontend into English and giving each screen a commercial role, the repository now behaves like a credible product demo rather than a class exercise.

> Portfolio takeaway: the project now shows frontend polish, information architecture, and product thinking in a way that non-technical reviewers can understand quickly.
